

CONNECTIONS TO ESP32 ARE AS FOLLOWS

NOTE : Better try this with HARDWARE. Because if we do in a online Website, as the online web don't have any Sensors, it gives us a default value 24°C every time which may not detect any situation for the fire accident(Usually Fire accidents occur when the temperature in the room is greater than 57°C).But using a Hardware device, perfect temperature is detected, which rings the alarm when Fire accident occur.
